

XIP

Rapid and Extensible Software Development for Medical Imaging

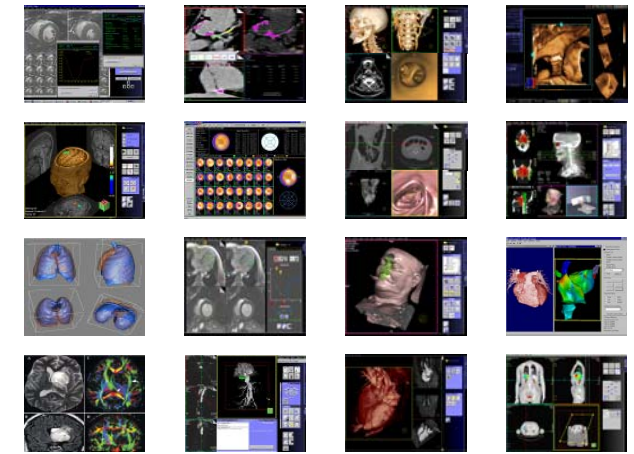

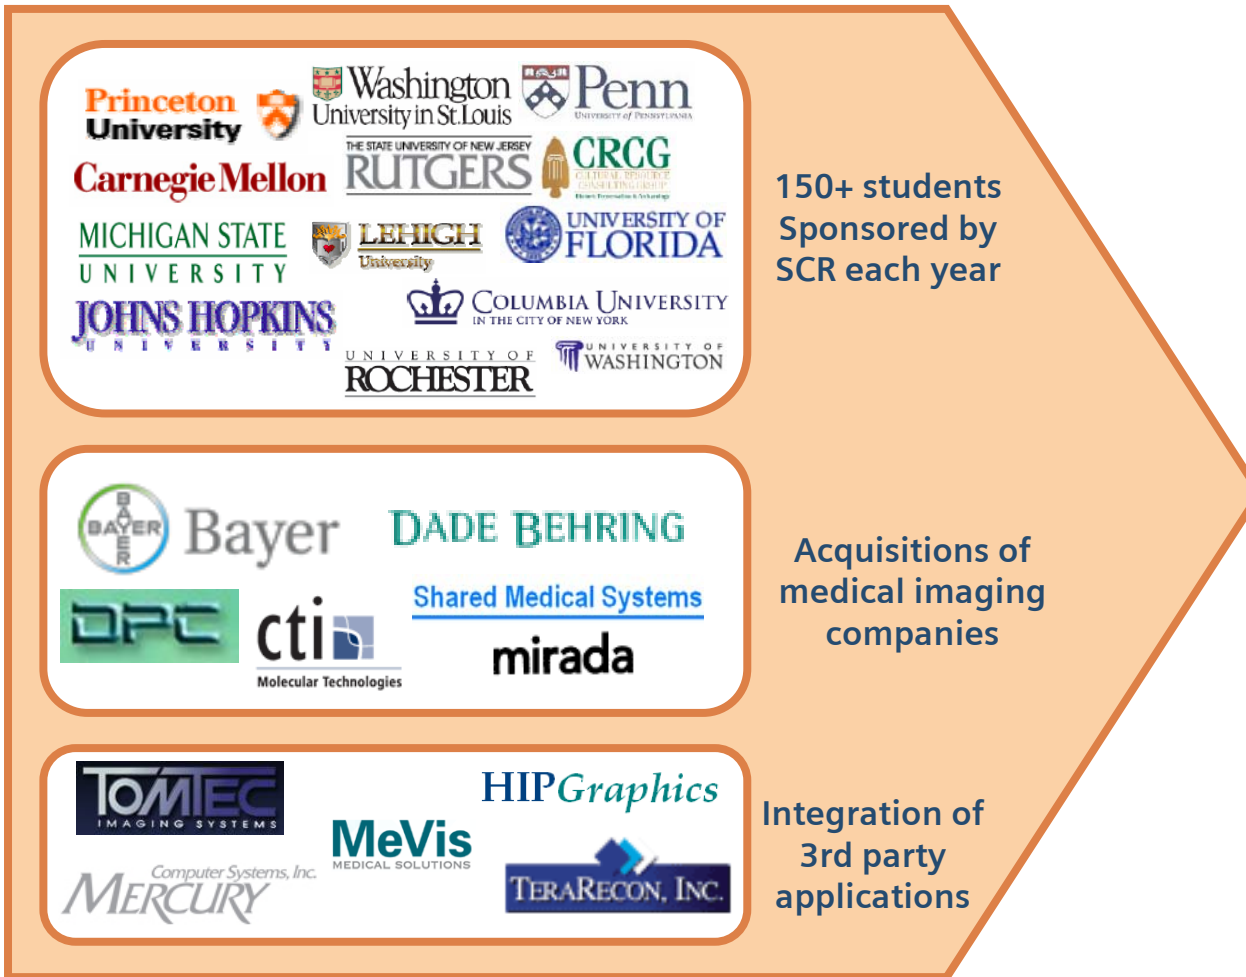

Gianluca Paladini
Program Manager, Imaging Architectures
Siemens Corporate Research
Imaging & Visualization Department
gianluca.paladini@siemens.com

Challenges:

Product Integration and Interoperability

Integrating the results of academic & clinical collaborations, software platforms of different companies and third-party applications into a unified architecture is a major challenge

QSR-Compliant PRODUCTS

Megatrend: Imaging Biomarkers in Drug Discovery

Molecular Imaging Software Development Pipeline

SIEMENS

Probe / Target / CA
Discovery,
Animal Testing

Clinical
Trials

Clinical Feasibility
and Acceptance

Clinical
Operations

- 10's to 100's of new disease-specific molecular imaging applications in next 10 years

- Radiologists Need:
 - Agent-customized imaging
 - More efficient development for clinical research

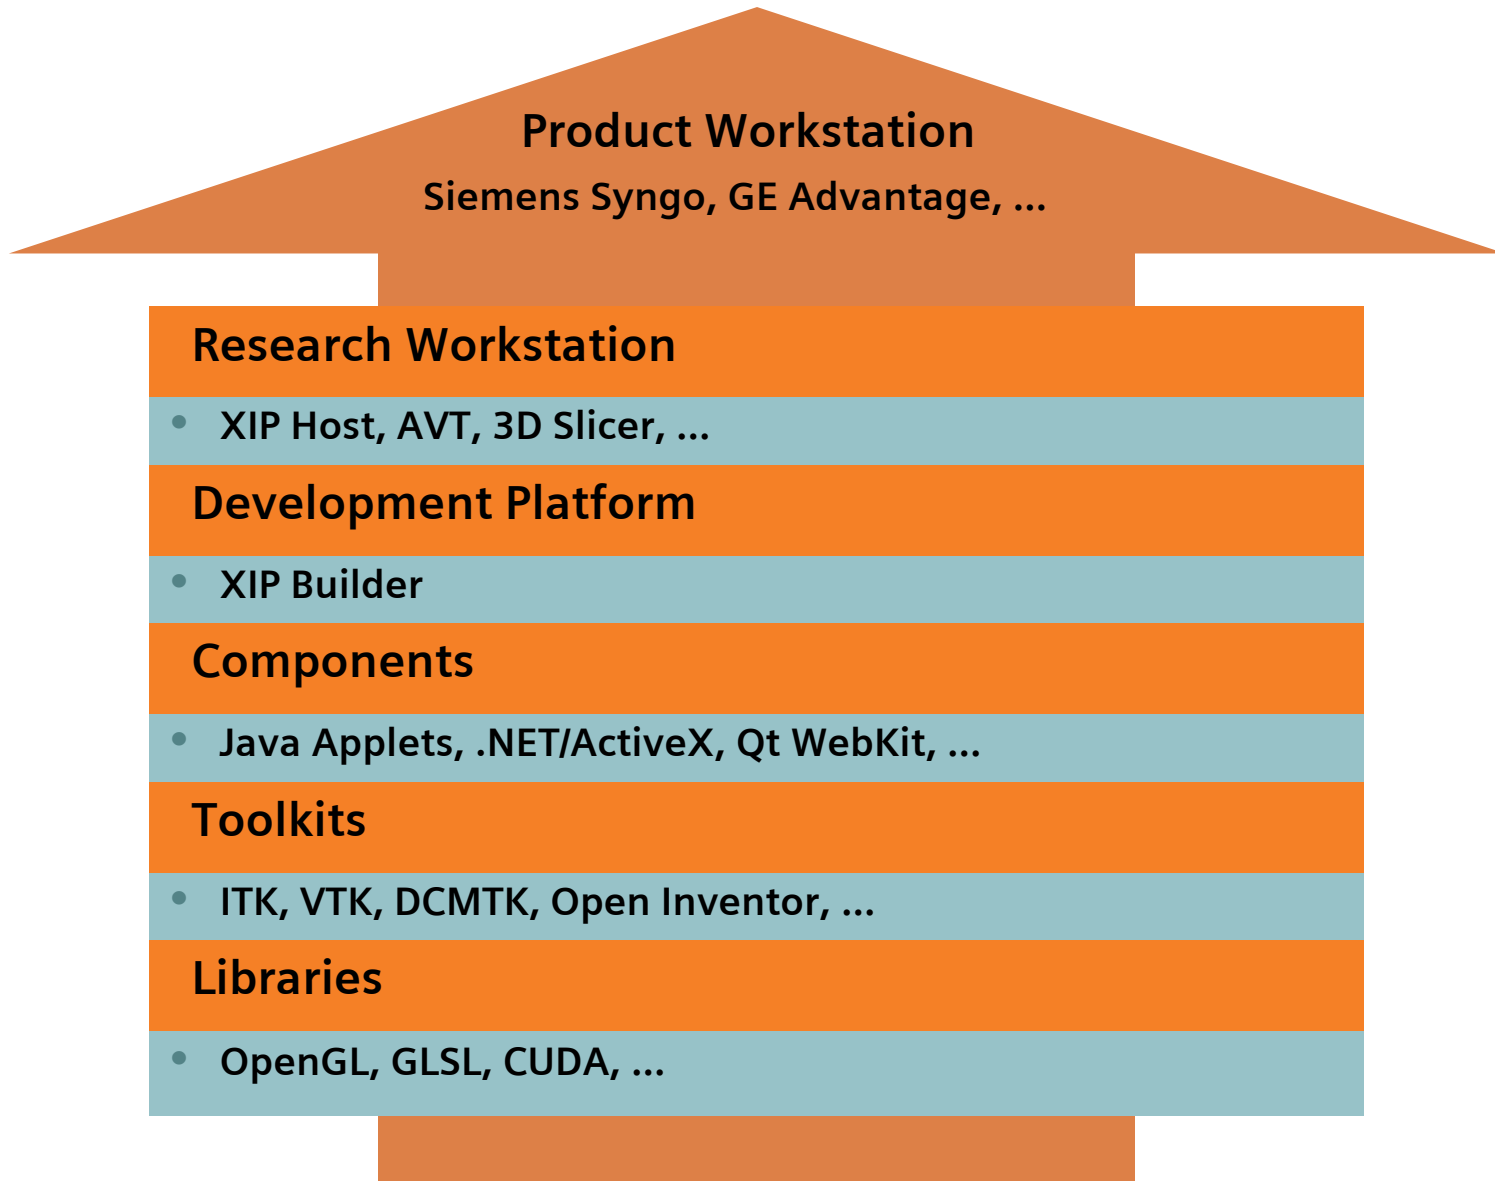

- Hospitals Need:
 - Agent-optimized imaging across all workstation platforms

A new model for imaging software development is needed to efficiently bring molecular agents to the clinic

Accelerating Time To Market

Rapid Transfer from Prototype to Product

SIEMENS

Accelerating Time To Market

Rapid Transfer from Prototype to Product

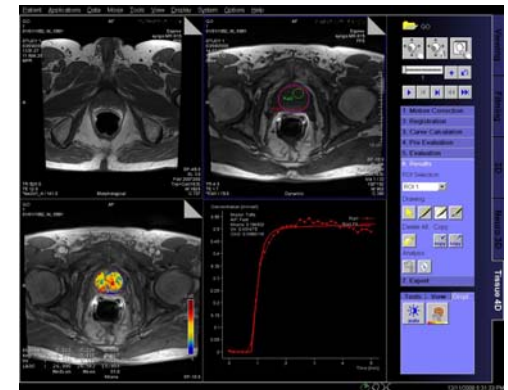

Rapid Prototyping IDE provides a graphical editor to create visualization graphs and processing pipelines

Standalone application easily deployable to clinical collaborators is used to refine workflow and algorithms based their feedback

Standardized middleware and components to ease the integration of prototyping results into product platform for clinical applications

Feedback from Pharma Plug-in Concept

- **Why re-implement the same image analysis software for a particular agent on each vendor's workstation?**
 - ▣ An interoperable plug-in environment can facilitate collaboration between imaging vendors and Pharma companies, enabling new business models

Market the combination of a molecular imaging agent with its disease and organ specific image acquisition & analysis

Commercial workstations are extended to execute drug-specific plug-ins

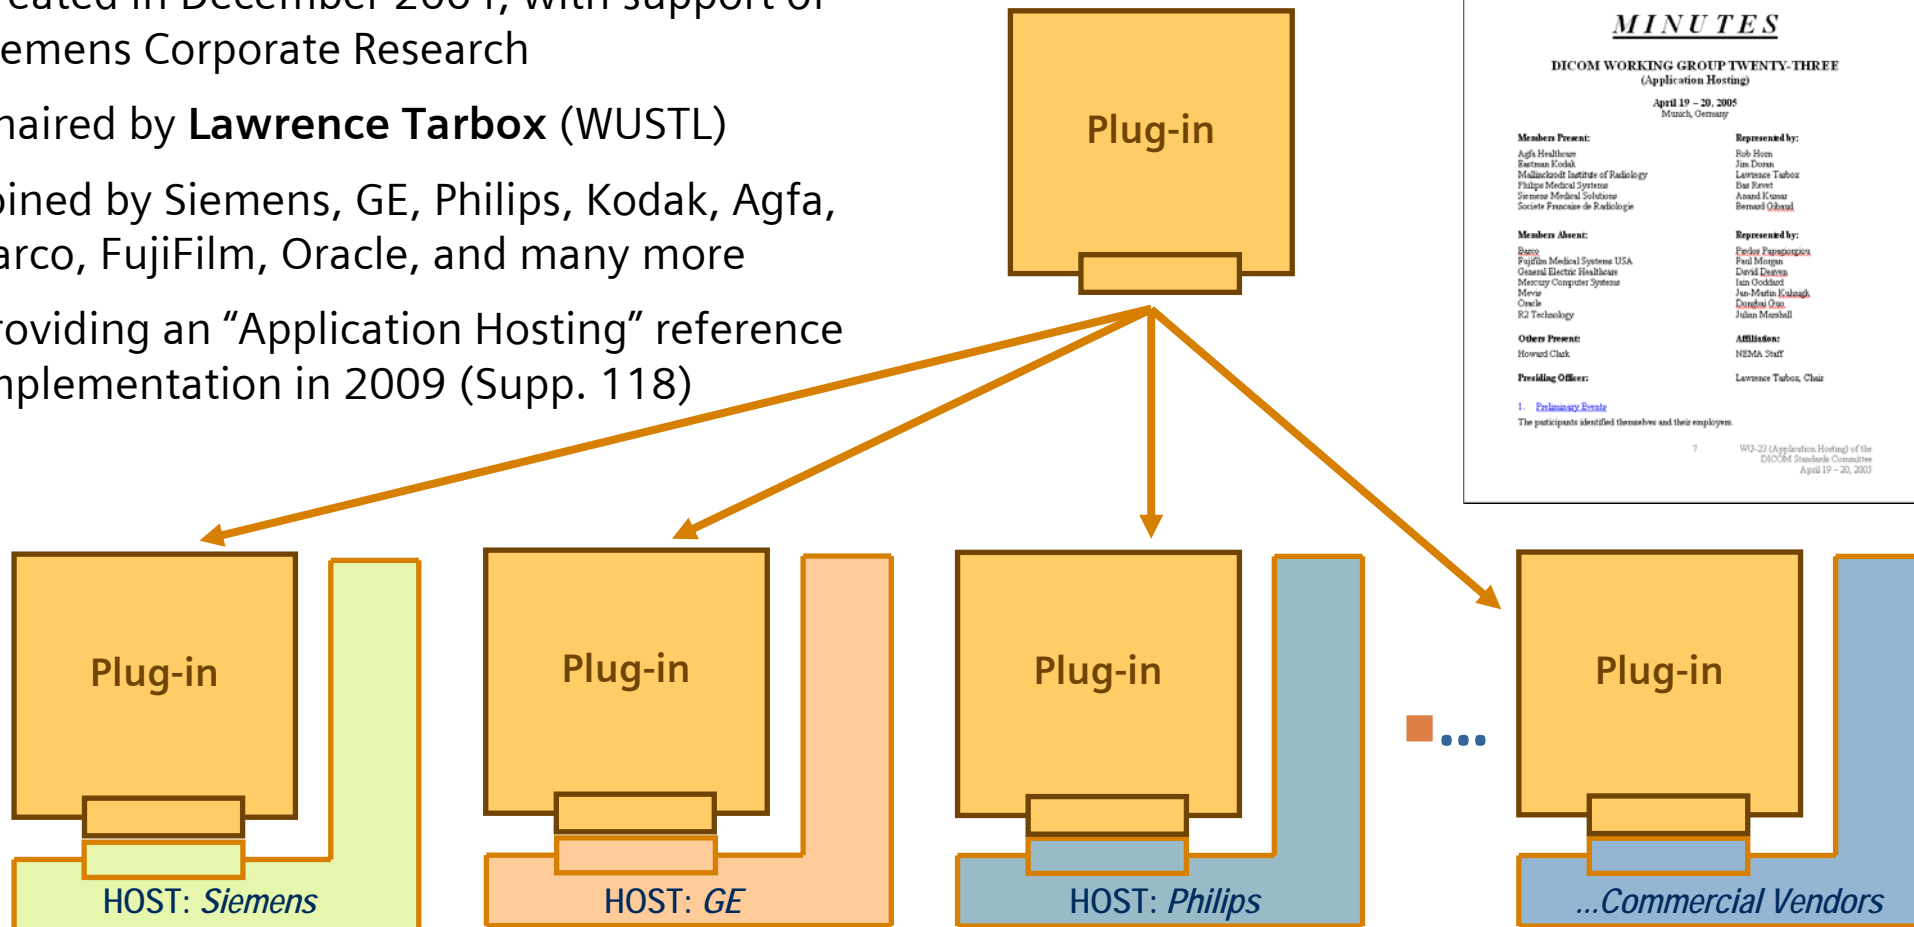

SIEMENS PHILIPS

TOSHIBA AGFA 

...and many other imaging vendors

Accelerating Time To Market Standardization

- **DICOM Working Group 23**
- Created in December 2004, with support of Siemens Corporate Research
- Chaired by **Lawrence Tarbox** (WUSTL)
- Joined by Siemens, GE, Philips, Kodak, Agfa, Barco, FujiFilm, Oracle, and many more
- Providing an “Application Hosting” reference implementation in 2009 (Supp. 118)

→ DICOM Supplement 118 is open for public comment as of Jan. 2009
ftp://medical.nema.org/medical/dicom/supps/sup118_pc.pdf

- ❑ caBIG community is composed of 900 developers from 50 NCI-designated Cancer Centers and a multitude of organizations working on over 70 projects
- ❑ NCI needed an open-architecture development environment for rapid prototyping & collaboration
- ❑ NCI funded the creation of XIP in order to have an extensible platform for caBIG's Imaging Workspace

eXtensible Imaging Platform (XIP)

- Includes a reference implementation of WG23 emerging standard
- Collaboration with Mallinckrodt Institute of Radiology (WUSTL)
- Demonstrations at RSNA InfoRad 2006, 2007, 2008
- First release of XIP was available to caBIG community Spring 2007

Interactive Design of Open Inventor Scene Graphs and pipelines

The screenshot displays the XIP Builder - CPUmpr interface, which is used for interactive design of Open Inventor scene graphs and pipelines. The interface is divided into several main sections:

- Scene Objects:** A list of available scene objects on the left, including `SoXipBoundingBox`, `SoXipBox`, `SoXipBufferMask`, `SoXipCPUMprRender`, `SoXipCaptureImage`, `SoXipCheckGLStacks`, `SoXipClearBuffer`, `SoXipClearFbo`, `SoXipClipPlane`, `SoXipClipPlaneKit`, `SoXipClipPlanesShaderSetup`, `SoXipComposeMFDicom`, `SoXipComposeMFIImage`, `SoXipComposeVec6`, `SoXipContour`, `SoXipCube`, `SoXipDecomposeMFDicom`, `SoXipDecomposeMFIImage`, `SoXipDecomposeMFIInt32`, `SoXipDecomposeVec6`, `SoXipDepthTest`, `SoXipDicomExaminer`, `SoXipDicomExtractSlice`, `SoXipDicomOverlayManager`, `SoXipDicomSort3D`, `SoXipDicomWindowLevel`, `SoXipDirectRaycaster`, `SoXipDisableTexturing`, `SoXipDisplayImageText`, `SoXipDogEar`, `SoXipDrawClipPlane`, `SoXipDrawImage`, `SoXipDrawQuad`, `SoXipDropShadowStyle`, and `SoXipEditText2`.
- Scene Graph:** A central area showing a hierarchical scene graph. The root node is `SoXipViewportGroup`, which branches into two `Separator` nodes. The left `Separator` contains `SoXipMprExaminer` and `SoXipCPUMprRender`. The right `Separator` contains `SoXipMprExaminer` and `SoXipCPUMprRender`. Below these are three `Group` nodes, each containing a `SoXipMprPlane` node.
- 3D Viewer:** A window titled "Separator" showing a 3D medical image viewer. It displays four views: a sagittal view (top-left), a coronal view (top-right), an axial view (bottom-left), and a posterior view (bottom-right). The viewer includes a scale bar (10 cm) and a slice level indicator (SL: 2.000). The patient information is displayed as: ECR Case # 8, AWE20162042.175.1107501869, 09.56:48.01, MAYO CLINIC CT 3R, Sensation 64, syngo CT 2005A, FAUBION WILLIAM ALVIS M, 914Y, 09.56:48.01, 5 IMA 99, FFS, KV 120, mAs 226, TI 500 msec, CT 0, SL: 2.000, FOV 0 mm, B40f.
- Properties Node:** A window titled "Properties Node" showing the properties of the selected node. The properties are: center 0.5 0.533065 0.631148, color 1 0 0, id 0, and stepSize 0.
- SoXipMprExaminer Properties:** A window titled "SoXipMprExaminer" showing the properties of the selected `SoXipMprExaminer` node. The properties are: callbackList, orientation FEET, viewOrientation Trigger, viewAll Trigger, stepNext Trigger, stepPrevious Trigger, key (), and mouse BUTTON1.

Why Open Inventor?

- Instead of implementing yet another library design, XIP extends Open Inventor[®] (free, LGPL) with new engines, nodes, and manipulators for Medical Imaging
 - ▣ **Engines** enable the creation of processing pipelines
→ well known concept in Computer Vision
 - ▣ **Nodes** support the concept of scene graphs, which are hierarchical structures of objects describing what needs to be visualized in 2D/3D
→ well known concept in Computer Graphics
 - ▣ **Manipulators** handle input devices, measurements and coordinate transforms in response to user interaction via a simple event model
 - ▣ **Field Converters** automatically handle data conversion between different field connection types
→ facilitates interoperability between wrapped libraries
 - ▣ **Serialization** is built-in via Open Inventor's VRML standard → facilitates exchange of functionality
- Leveraging excellent Sgi's documentation for a short learning curve (Inventor Mentor/ToolMaker)

sgi Open Inventor[®]

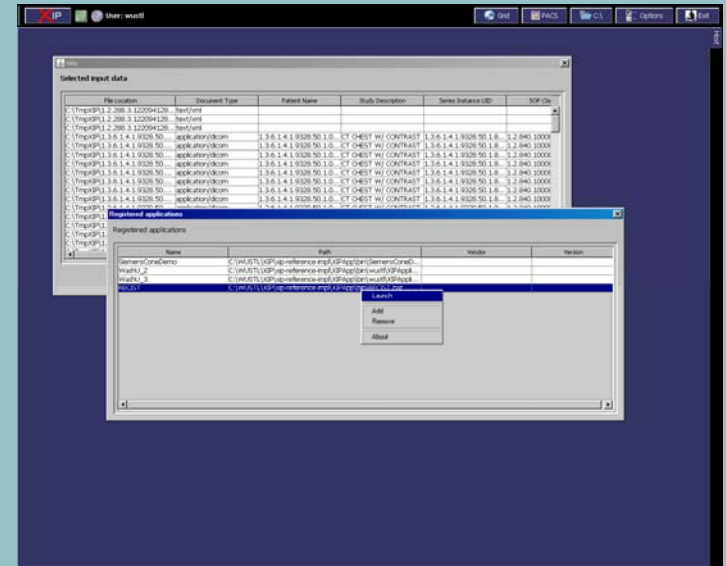

Highlights

- Makes many different open source libraries Interoperable (Open Inventor, ITK, VTK, DCMTK, GLSL, CUDA, AIM,...)
- Design can be rapidly prototyped, tested and saved to a file which can be loaded in application GUI written in C++, Java or HTML
- Ability to group sub-graphs into high level reusable packages
- Tabbed navigation facilitates navigation through large projects
- Ability to preview processing results at any stage of the graph/pipeline
- Watch window for debugging purposes
- Integrated Performance Profiling feature
- Built-in batch mode processing for automated testing/validation

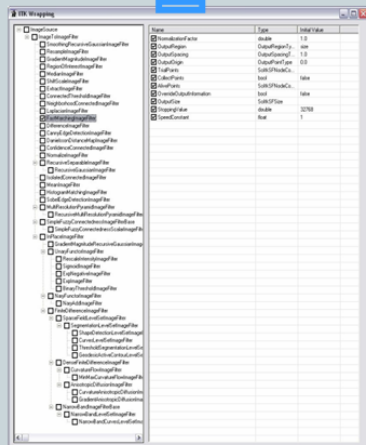

XIP Host Reference Implementation

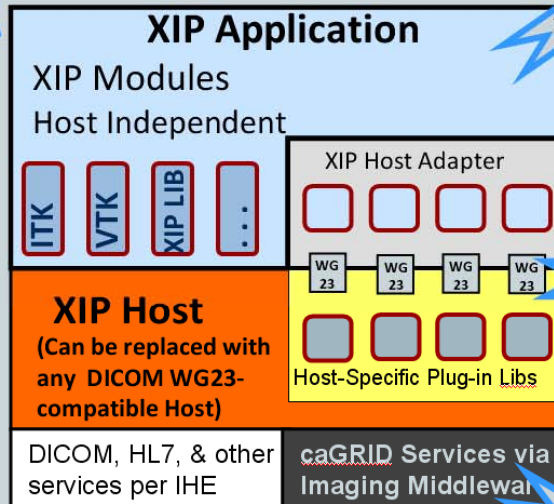

- Provides the infrastructure in which XIP or DICOM WG-23 Applications run
 - ▣ Authenticates user
 - ▣ Manages installation, launching, and termination of XIP Applications
 - ▣ Provides data and services to XIP Applications
 - ▣ Accepts status information and results back from XIP Applications
 - ▣ Deals with auditing and controls access to services and data
- Isolates the XIP application from the nature of databases, archives, networks, and possibly image data formats
 - ▣ Manages caGRID interactions and security
 - ▣ Manages access to DICOM networks, objects, and services
 - ▣ Maps images and associated meta-data between their native form and a common form useable by the XIP application
 - ▣ IHE General Purpose Worklist support

XIP Application Builder

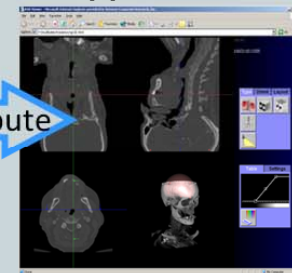

**XIP Class Library
Auto Conversion Tool**

Medical Imaging Workstation

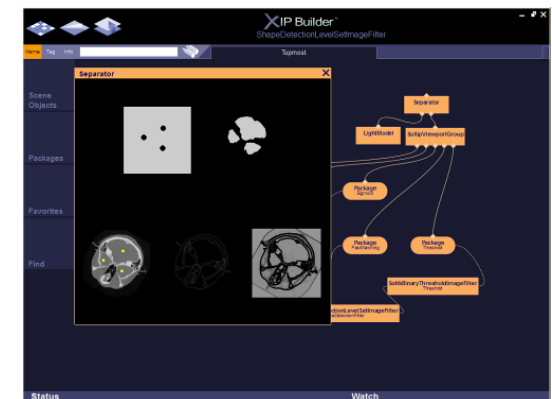

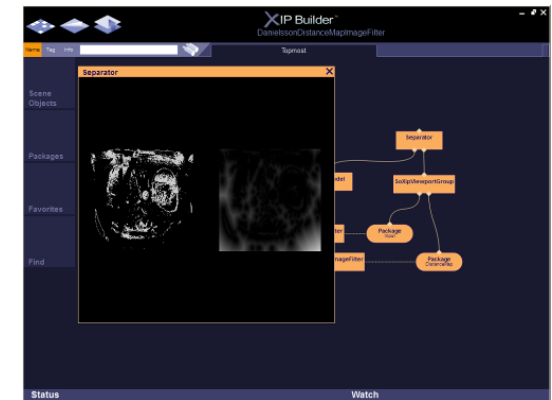

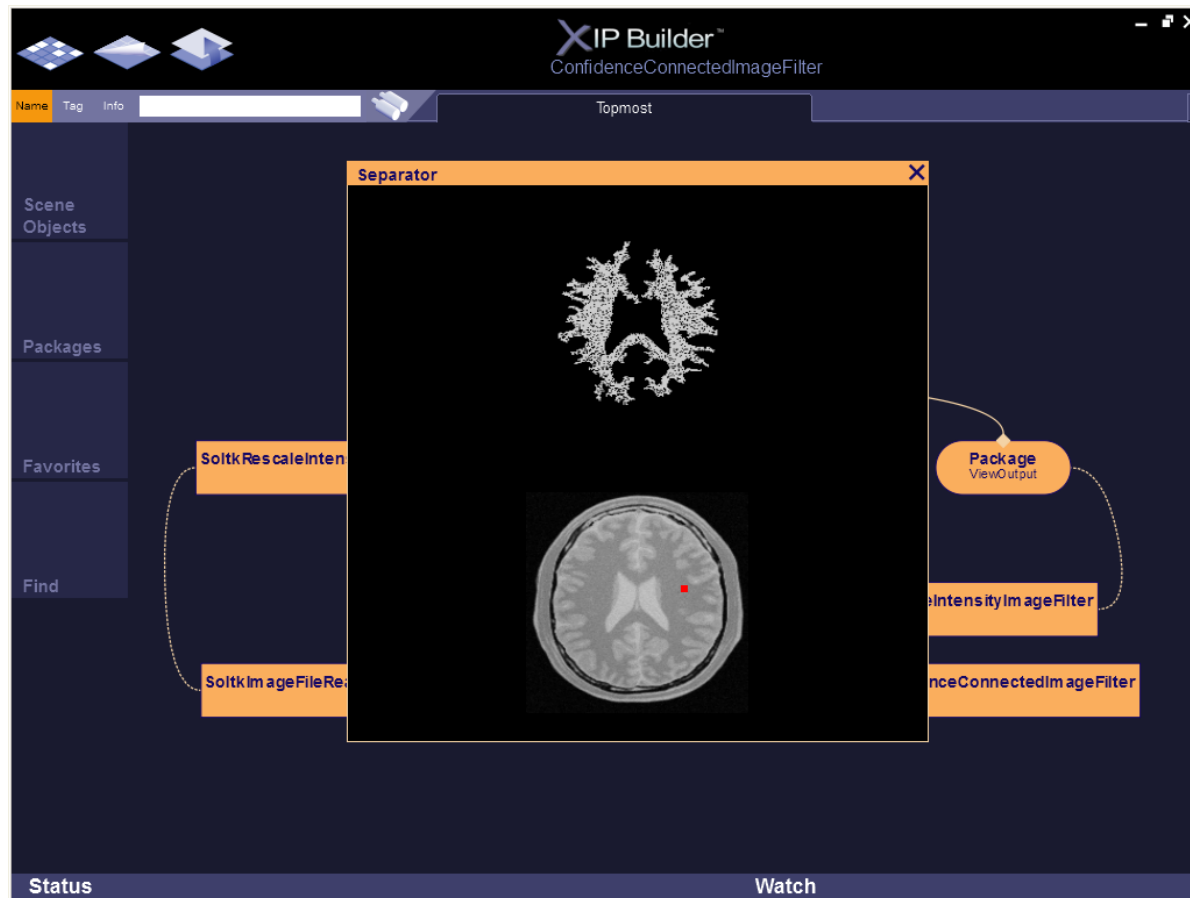

Web-based Application

Standalone Application

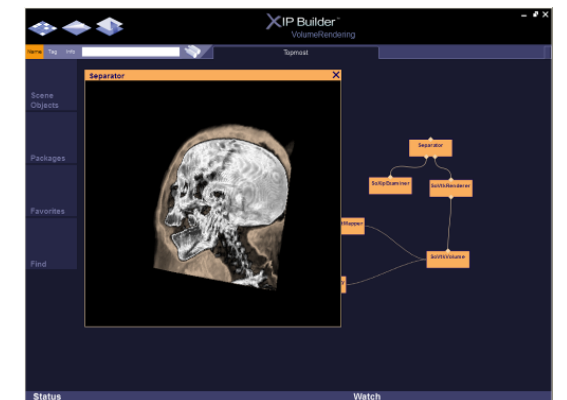

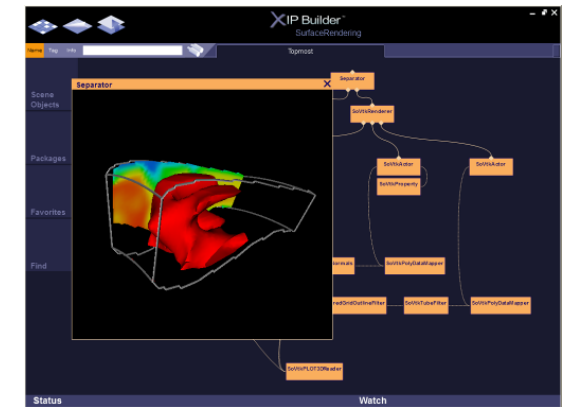

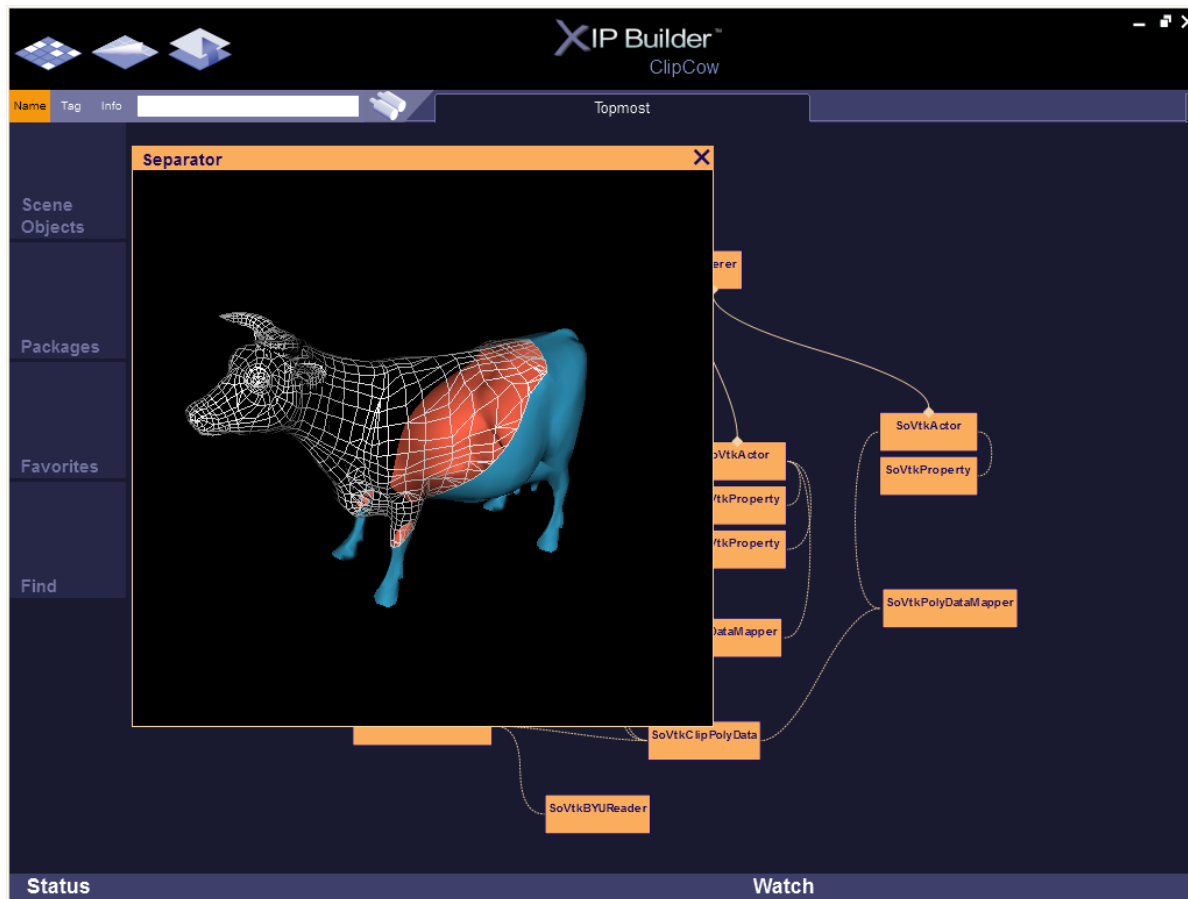

- ❑ Scripts to automatically wrap entire library (1000's of objects)
- ❑ 261 wrapped objects are fully tested
- ❑ 125 examples matching the IKT User's Guide

VTK Support

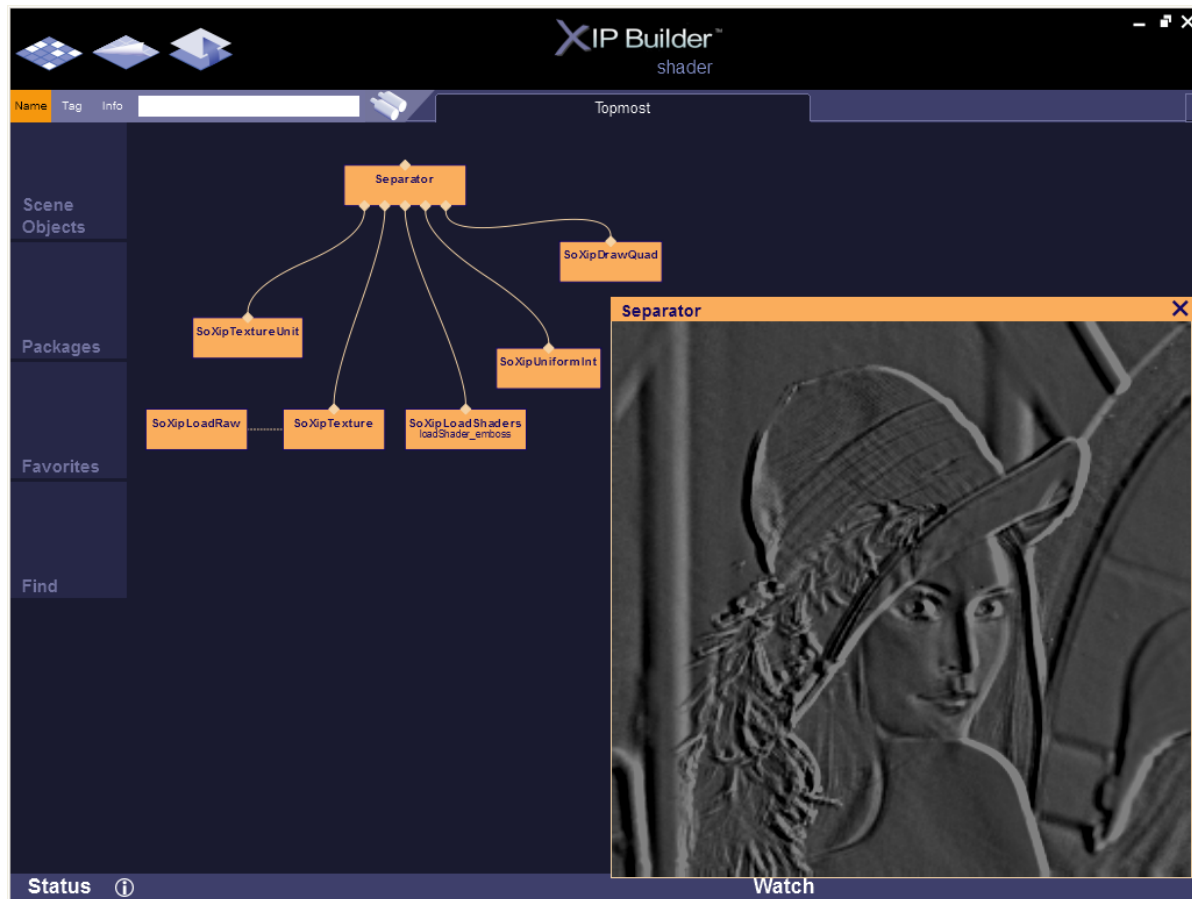

- ❑ Scripts to automatically wrap entire library (1000's of objects)
- ❑ 308 objects undergoing testing
- ❑ Various examples available (under development)

- ❑ High-level DICOM loader objects based on DCMTK
- ❑ Modular DICOM Sorting objects
- ❑ Objects for 2D on-demand-paging as well as 3D volume construction
- ❑ Flexible display of DICOM elements as overlay text information

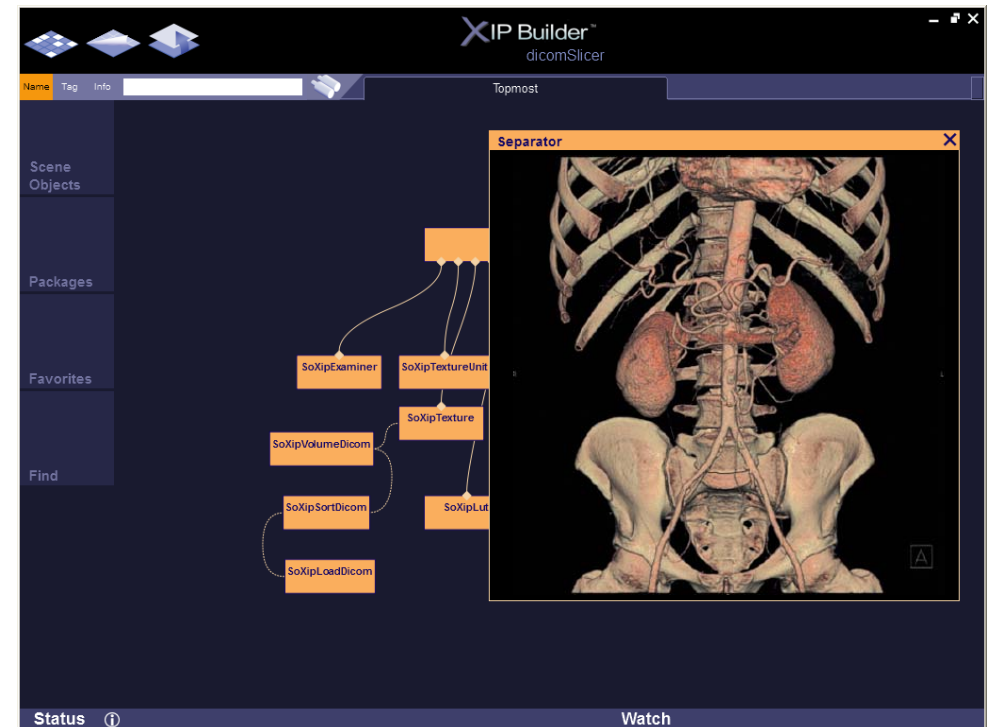

- ❑ Support for GLSL programs (C-like language)
- ❑ All underlying OpenGL 2.0 setup is taken care of
- ❑ Easy way for researchers to implement hardware-accelerated algorithms

Programmable 3D Volume Rendering and MPR

- Leverages the processing power of modern GPU graphics cards (within the constraints of the GPU card's memory, and using only standard algorithms known in the art)
- Fully programmable using the GLSL language
- Great flexibility for researchers to implement new 3D visualization ideas
- Supports multiple volumes fused in the same scene
- Synchronized 3D navigation of Oblique MPR planes

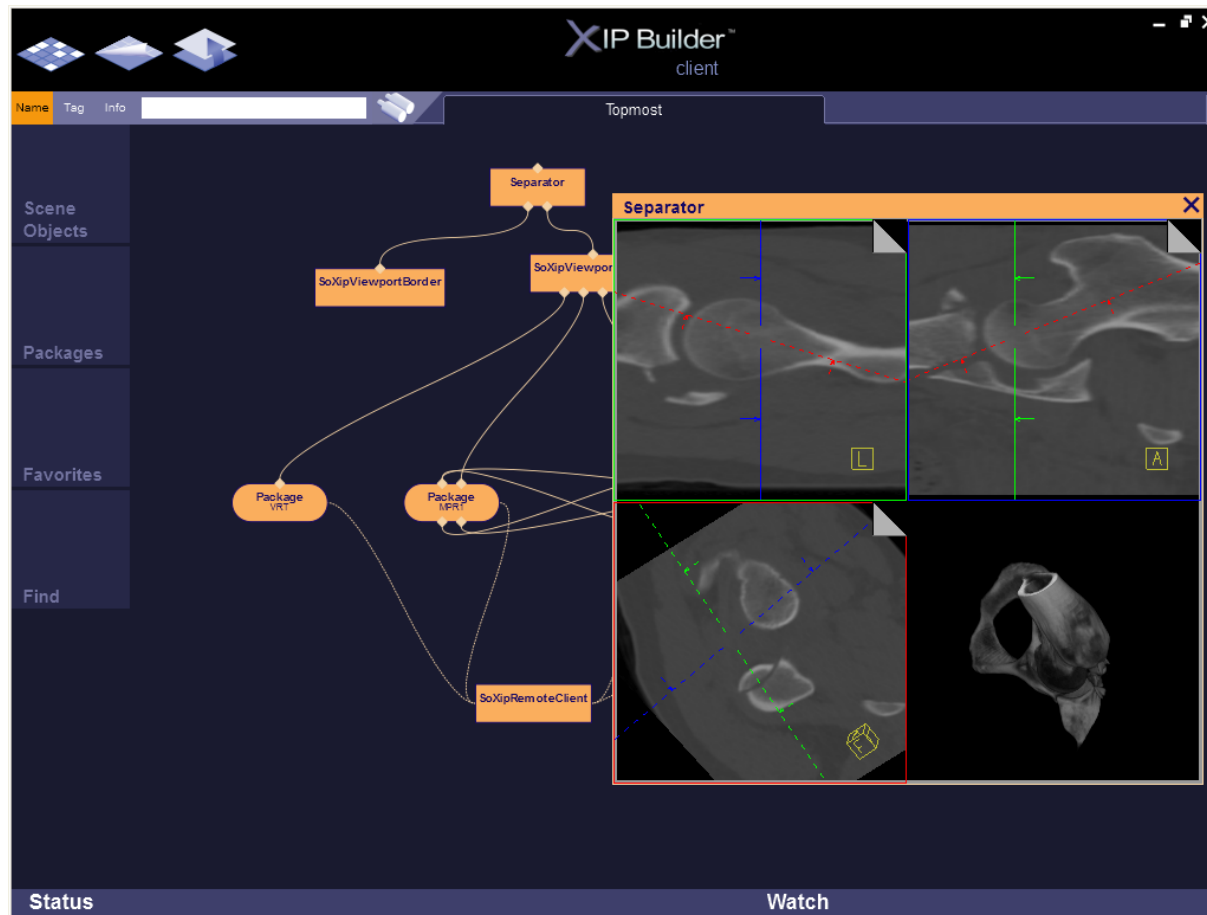

Overlay/markup graphics & Measurements

- A collection of 2D/3D shapes for a variety of image markup applications (lines, polygons, splines...)
- RECIST, WHO, area and volume measurements
- Graph plotting and charting
- Support for DICOM Presentation States

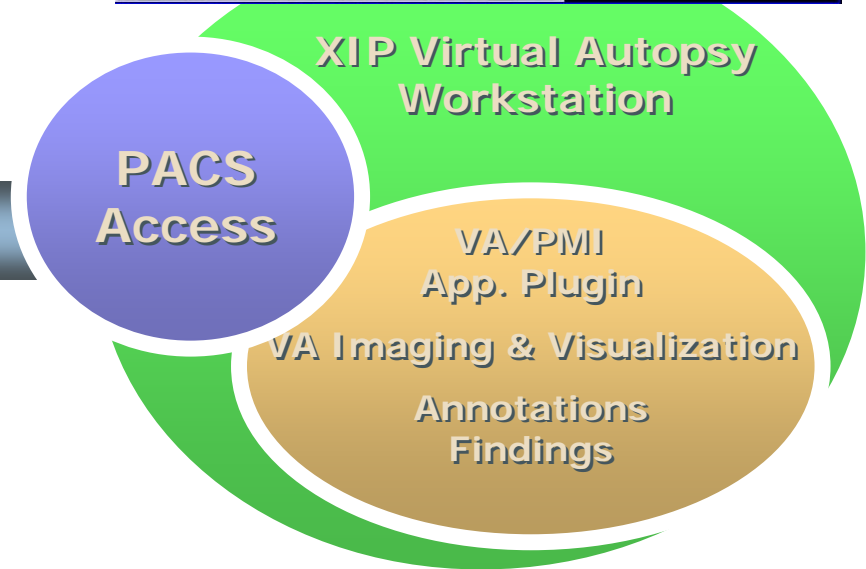

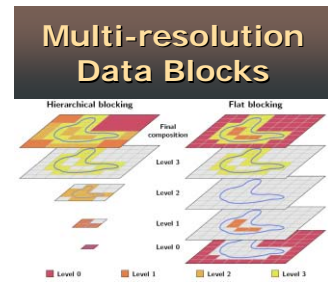

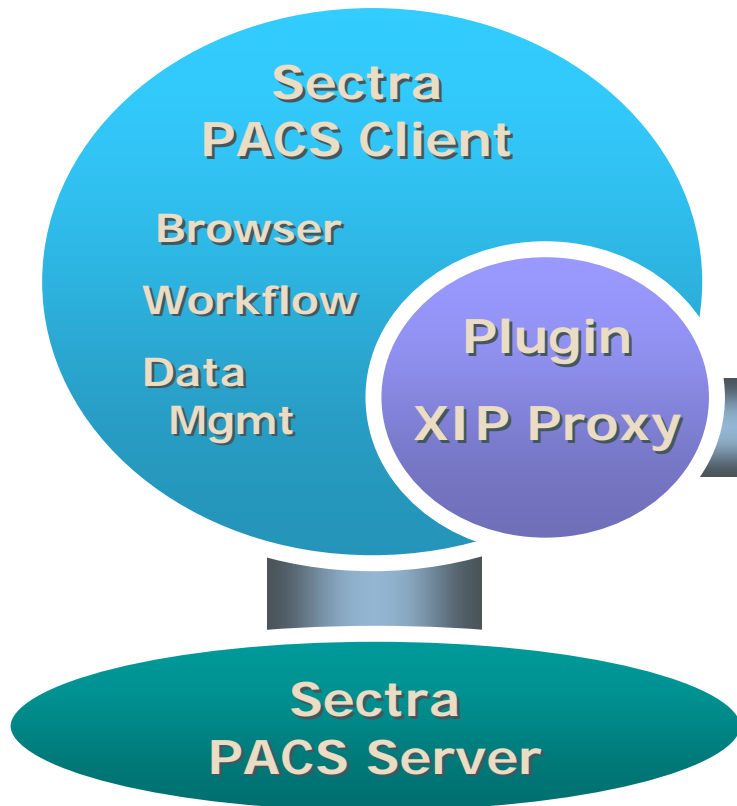

Remote Client/Server Visualization

- Enables collaborative visualization over LANs, Intranets and/or the Internet
- Volume rendering and MPR fully supported
- Socket-based, it only needs the IP address of the XIP server process
- Remote loading on server is triggered by the client

Upcoming Feature: Multi-Resolution Client/server approach

- Virtual Autopsy Workstation funded by Swedish government
- Uses full-body 0.3 mm dual-energy scans
- Linköping Univ CMIV + Siemens + Sectra

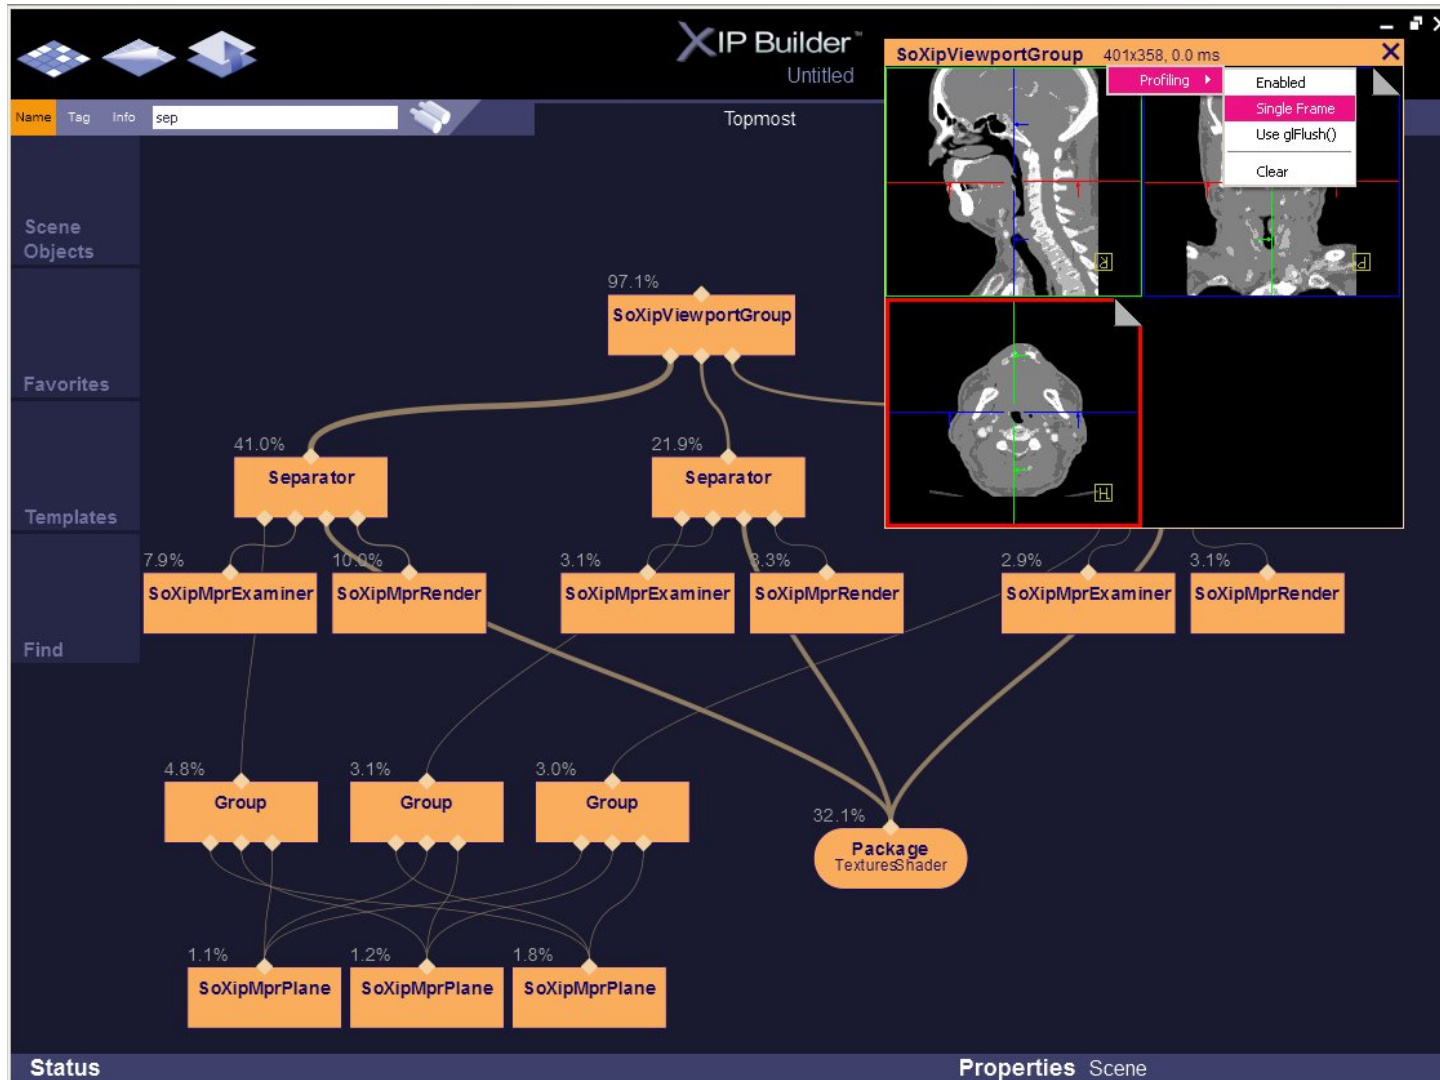

Large data is on the back-end

Application logic and LOD selection is on the front-end

Recent New Features: Integrated Performance Profiler

- Visual representation of performance in order to easily identify bottleneck and optimize execution

Recent New Features: Automatic HTML Document Generation

- Generates design documentation
- Can store/print requirement keys, class descriptions, connection diagrams

markerType	DIAMOND

PLOT DynamicPixelCurve

PLOT_ParametricPixelCurve

This package is responsible for displaying the pixel curve and corresponding fitted curve of a time series, given a coordinate. This coordinate can be either extracted via the pixel lens tool (interactive mode, uses a 1x1 kernel) or by picking (bigger kernel size allows for smoothing).

The point1 field holds the coordinate obtained via picking.

The point2 field holds the coordinate obtained via pixel lens.

#126 - Separator

The nodes #127, #128 and #136 are children of this group.

#127 - SoXipAutoScale

Recent New Features: CUDA-based High-Performance Computing

- Introduced at MICCAI HPC Workshop 2008 (V. Giden, P. Ljung, G. Paladini, T. Moeller)
- Currently adding: Global Memory Management for both CUDA and Texture memory; 3D texture processing; collection of CUDA-accelerated algorithms (distance transf., PDE solver, non-linear diffusion filtering, etc.)

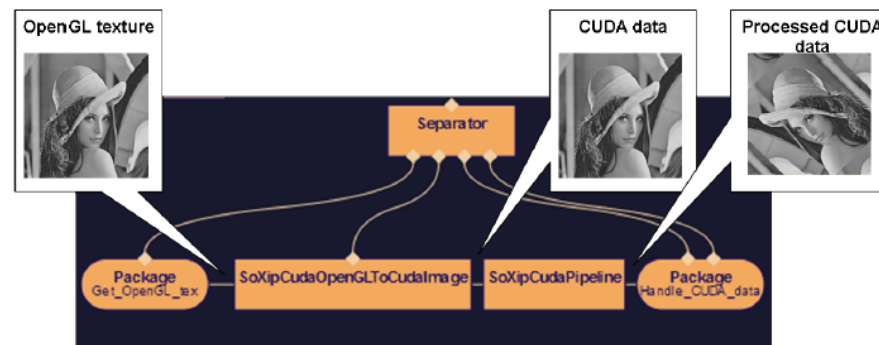

nVidia Tesla C1060 – 0.9 TERAFLUPS

nVidia Tesla S1070 – 4 TERAFLUPS

(a) Output data from the pipeline engine is used to create OpenGL textures.

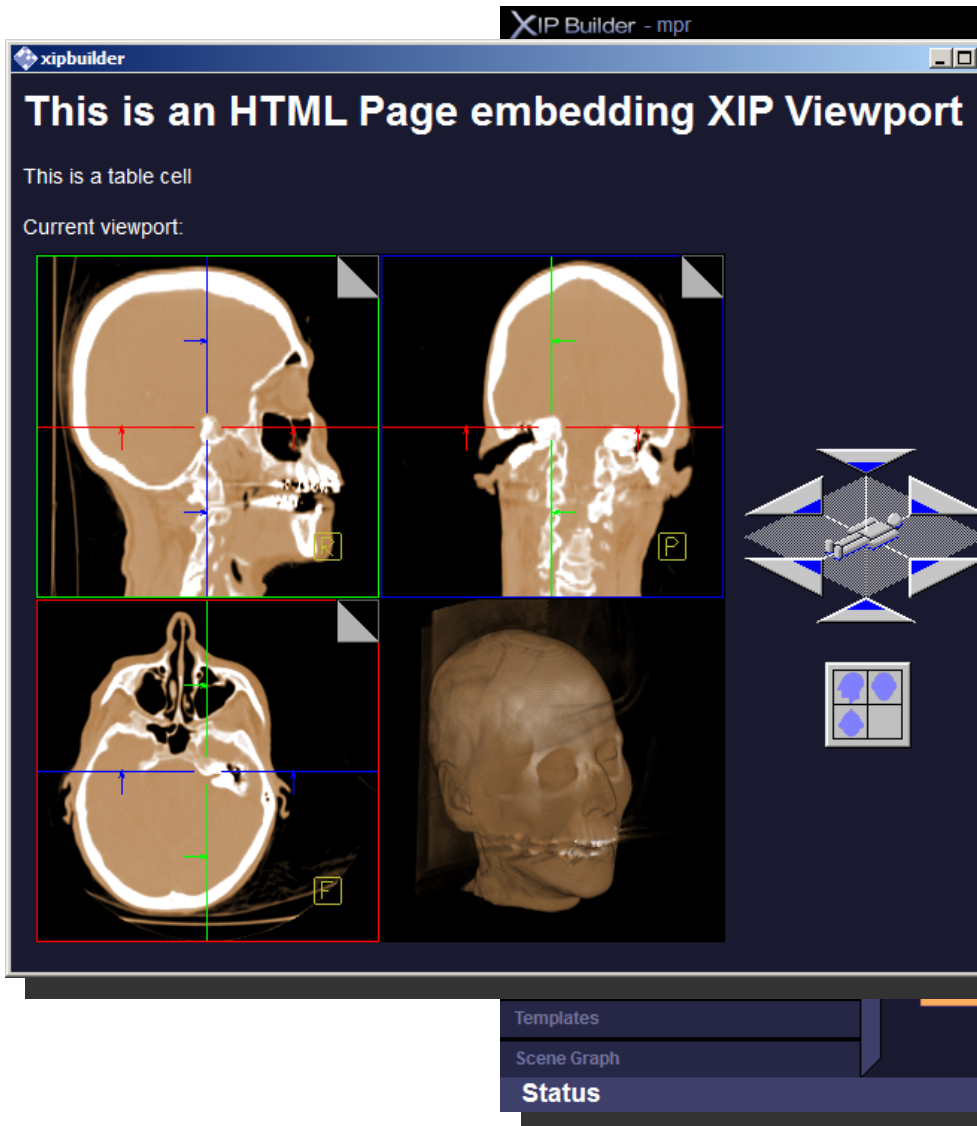

(b) OpenGL textures are used to create CUDA data which is processed by kernels in the pipeline engine.

Recent New Features:

SIEMENS

View and Control Scene Graph with HTML/JavaScript

```
<script>
widget.connectJSSlot('stateChanged(const QString &, const QSta

window.onStateChanged = function onStateChanged(p, v)
{
    if (v == 'RenderArea.current')
    {
        document.getElementById('output').innerText = "Current

    }
}

function onLoad()
{
    setParam('AddFieldSensor', 'RenderArea.current');
}
function setParam(p, v)
{
    widget.setParam(p+"", "+v);
}

function onSetOrientation(orient)
{
    var c = widget.getParam('RenderArea.current');
    setParam('MprExaminer' + c + '.orientation', orient);
    setParam('MprExaminer' + c + '.viewOrientation', '');
    setParam('MprExaminer' + c + '.viewAll', '');
}
function onOrientationDefault()
{
    setParam('MprExaminer0.orientation', 'FEET');
    setParam('MprExaminer0.viewOrientation', '');
    setParam('MprExaminer0.viewAll', '');

    setParam('MprExaminer1.orientation', 'RIGHT');
    setParam('MprExaminer1.viewOrientation', '');
    setParam('MprExaminer1.viewAll', '');
}

```

Recent New Features:

Support for Qt UI Designer, Qt JavaScript, Python Script

SIEMENS

The image displays the Qt Designer interface. On the left, the 'Widget Box' contains various UI elements categorized into Layouts, Spacers, Buttons, Item Views (Model-Based), and Item Widget...Item-Based. The central canvas shows a 'Window leveling' dialog with a 'Window:' slider, a 'Level:' slider, and 'Reset' and 'Popup' buttons. On the right, the 'renderWidget.js' file is open, showing JavaScript code that defines a 'Form' object with methods for setting parameters, connecting signals, and handling state changes.

```
function Form(ui)

    this.ui = ui;

    // Set default value for the sliders
    // Using ui.findChild(name) because the sliders are inside a groupbox
    ui.findChild("levelSlider").value = this.getParam('WindowLevelManip.level')*100;
    ui.findChild("windowSlider").value = this.getParam('WindowLevelManip.window')*100;

    // Add field sensors
    this.setParam('AddFieldSensor', 'WindowLevelManip.level');
    this.setParam('AddFieldSensor', 'WindowLevelManip.window');
    this.setParam('AddFieldSensor', 'RenderArea.current');

    var current = 1; // current active render area

    // connect controls
    this.ui.btnReset.clicked.connect(this, "reset");
    this.ui.btnPopup.clicked.connect(this, "popup");
    this.ui.findChild("levelSlider").valueChanged.connect(this, "setLevel");
    this.ui.findChild("windowSlider").valueChanged.connect(this, "setWindow");

    // connect Qt signal to callback function
    this.ui.widget["stateChanged(QString,QString)"].connect(this, "stateChanged");

    // setParam and getParam to interact with the scenegraph through the widget
    form.prototype.setParam = function(p,v)

        this.ui.widget.setParam(p+', '+v);

    form.prototype.getParam = function(p)

        return this.ui.widget.getParam(p);

    // callback function connected to the Qt signal
    // returns the new value of a sensor-controlled field
    form.prototype.stateChanged = function(v, p)
```

Recent New Features: Example of XIP volume rendering inside 3D Slicer

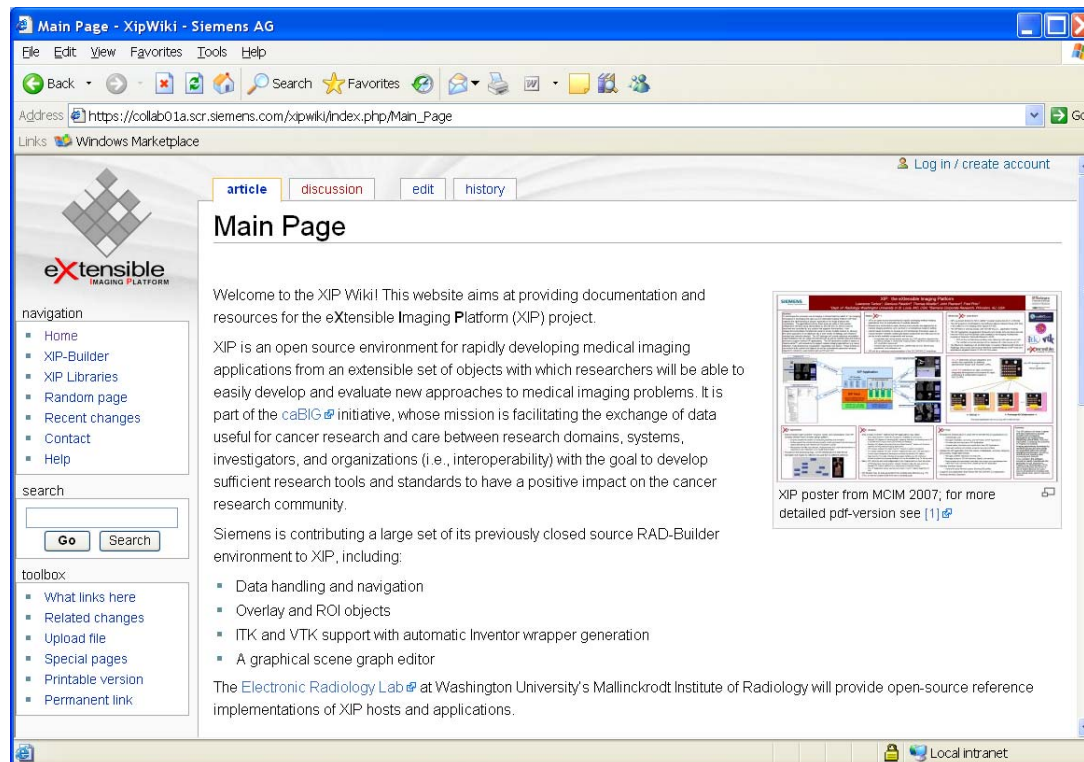

XIP Automatic Test Cases

- ❑ XIP Builder tool can run and execute programs in Batch Mode
- ❑ Command Mode syntax makes it possible to vary parameter values in order to create tests that validate XIP libraries
- ❑ 100's of tests already available

XIP Wiki Site for Imaging Framework

- ❑ Wiki is available at https://collab01a.scr.siemens.com/xipwiki/index.php/Main_Page
- ❑ Main web site for documentation, tutorials, reference help
- ❑ Clicking on any objects in XIP Builder and pressing F1 pop-up an online help page for such object
- ❑ Wiki allows caBIG developers to document their own objects in a central repository

- ❑ GForge developer's site can be accessed via the XIP Wiki
- ❑ Main web site for daily source code development and latest installation packages
- ❑ Stable, frozen releases are mirrored into caBIG's GForge site
- ❑ Provides SVN-based repository, forum, bug tracking tool, Cmake automated builds, Dashboard

The screenshot shows a web browser window displaying the GForge SVN repository for the XIP project. The address bar shows the URL: <https://collab01a.scr.siemens.com/gf/project/xip/scmsvn/?action=browse&path=%2Fsrc%2Fdatabase%2Fcore%2F>. The page title is "Projects > eXtensible Imaging Platform > SVN > Browse repository - Siemens AG".

The navigation menu includes: Home, My Stuff, Users, Projects: xip, Snippets, Summary, Reporting, Search, Forums, Tracker, Docs, News, Files, Lists, Wiki, SVN, Build.

The main content area shows the "Index of /src/database/core" directory. It indicates that 53 files are shown, and the directory revision is 205 (of 226). There is a "Sticky Revision" field with a "Set" button.

File	Rev.	Age	Author	Last log entry

_SbVariant.cpp	131	5 weeks	fhuguet	Added Examiner and Variant.
_SbXipCoordinateTransform.cpp	194	6 days	babu	Added class to convert image coordinate to world coordinate.
_SbXipDirtyFieldList.cpp	6	5 months	tmoeller	Added XIP core. Completed ITK port.
_SbXipDirtyFieldList.h	6	5 months	tmoeller	Added XIP core. Completed ITK port.
_SbXipImage.cpp	6	5 months	tmoeller	Added XIP core. Completed ITK port.
_SoMFVariant.cpp	131	5 weeks	fhuguet	Added Examiner and Variant.
_SoSFVariant.cpp	131	5 weeks	fhuguet	Added Examiner and Variant.
_SoXipActiveViewportElement.cpp	7	5 months	tmoeller	Added more classes to core that are needed by overlays.
_SoXipCursor.cpp	13	4 months	gein	Added an image viewer, a Raw image loader, a viewport group and some utility cla...

Boost in Productivity

More than 30 clinical prototypes/year based on XIP Builder

SIEMENS

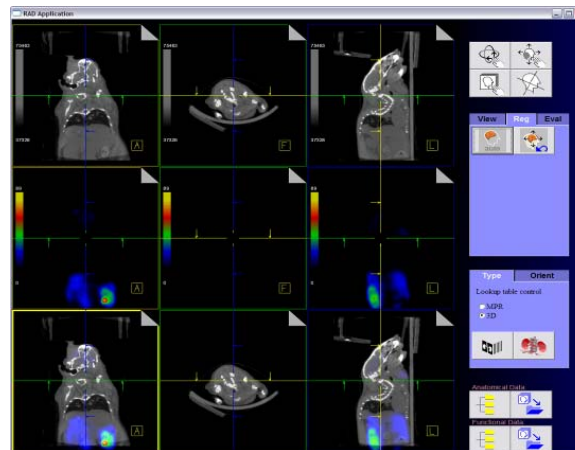

Demonstrated Value of Open XIP Platform

Some ongoing projects based on Open XIP – Government & Academia

- caBIG Open Source imaging libraries and XIP Builder Tool
- caBIG AVT Project (Algorithm Validation Toolkit)
- DoD TATRC/ACR's Interoperability in Medical Imaging
- DARPA deep-bleeder acoustic coagulation
- Beth Israel Intraoperative Fluorescent Imaging
- NTROI Optical Imaging for Drug Therapy Monitoring
- caBIG AIM Project (Annotation Imaging Markup based on XIP) - Northwestern Univ.
- UPENN prostate cancer multi-resolution histopathology fused with MR

In Vitro

Pre-Clinical

In Vivo

XIP for the Dept of Defense: Congressional Project led by ACR

- Soldiers frequently suffer from types of injuries that are rare for civilians, e.g., Traumatic Brain Injury (TBI) from Improvised Explosive Devices (IEDs)
- DOD Healthcare needs the ability to rapidly field vendor interoperable imaging solutions for such unique problems. ACR/SCR are working with the Army (TATRC) and the Navy (NNMC) to demonstrate that XIP & WG23 can meet these needs
- This project will leverage XIP and Qt's cross-platform compatibility and will deliver a TBI application running on Mac OS X
- MR anatomy, connectivity map, diffusion tracts, fMRI activation, segmented surfaces

XIP and caBIG Algorithm Validation Tools (AVT)

Image Analysis & Annotation

- Measure/annotate tumors with XIP

Assessment Database

- Captures Annotations & Provenance Data

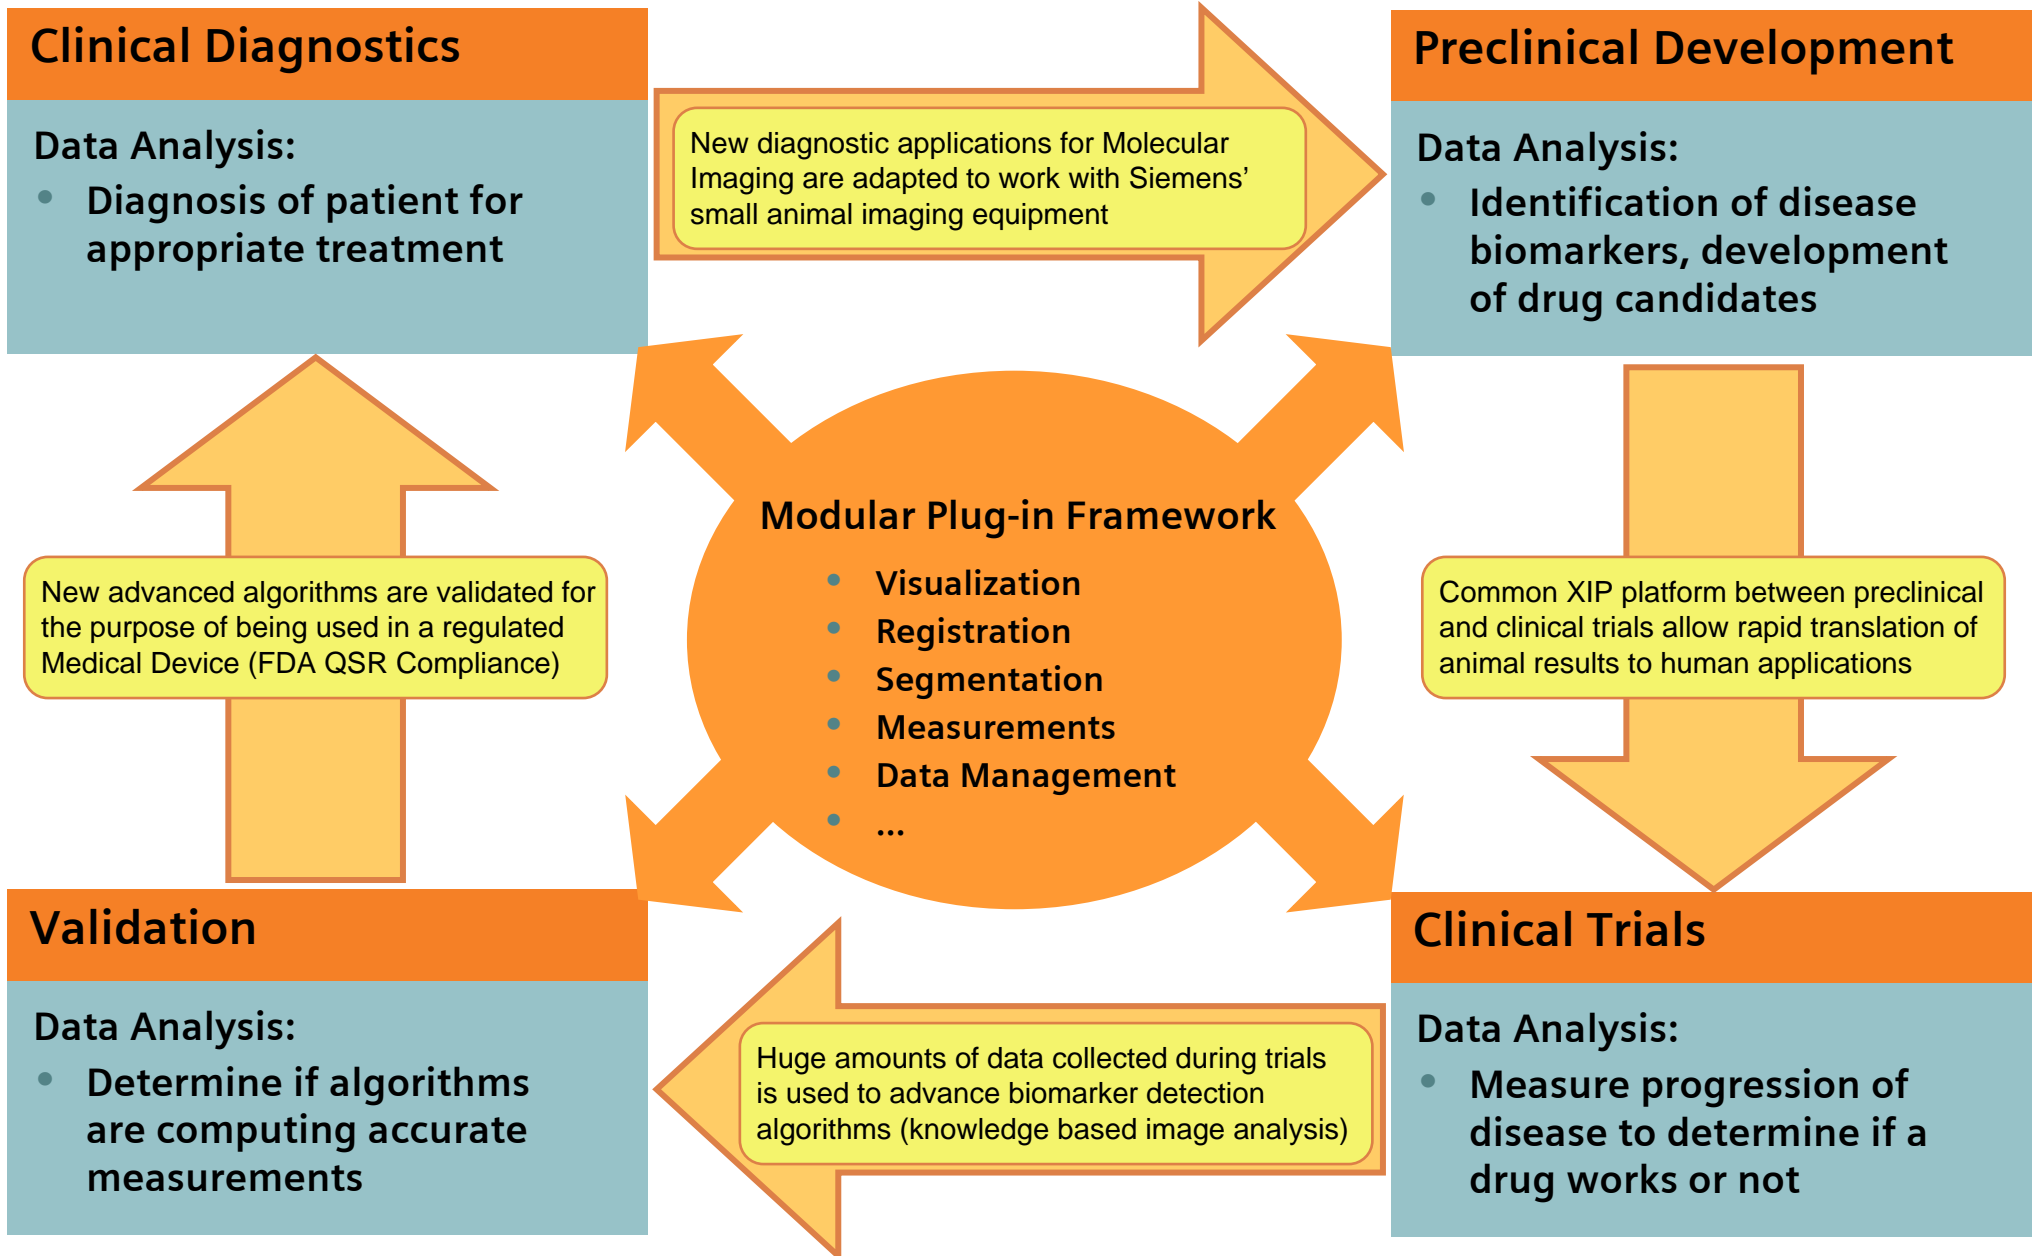

Measurement Validation

- Computes measurement statistics and correlations between metrics and outcomes

- ***XIP is the foundation of other caBIG tools, including AVT, which will be used to validate tumor change quantification algorithms for clinical trials***

Enabling Imaging Support Across the Biomedical Value Chain

Thank you for your attention!
