DTI Atlas Building – Santa Fe

- Casey Goodlett, Guido Gerig

Overview

- Algorithm [1]

- Inputs

- Geometry of atlas fibers

- Diffusion statistics

- Results, conclusions, and thoughts

Inputs

- Larger data set

- Image data

  - Scanner resolution

  - No distortion correction

Preprocessing

- Tensor estimation – DTIProcess from NeuroLib

    - Weighted least squares (3 iterations)

    - Background threshold 350

    - Time: 3-4 minutes per

- FA/MD/Color FA computation using DTIProcess

- Maximum eigenvalue image (sigma = 4.5 mm)

- ~minutes per-image, Xeon dual-core w/ 2GB (Memory is limiting factor for processing)

Registration

- Average baseline image registered to T2 atlas

  - RView

  - Cross-Correlation

  - 3 resolution levels

- Affine registration used as initalization for fluid registration (Joshi, Davis) [2]

  - Multi-resolution (3 levels)

  - Runs in ~15 minutes on 8 core machine 64 GB RAM

Fiber Tracking

- Computed on atlas tensor image

- ROIs redrawn in atlas based on sample ROIs

    - InsightSNAP 1.5.4 with FA and/or Color FA images

    - Arcuate drawn based on Susumu Mori's atlas

- FiberTracking 2.3.1 used with default parameters

Collection of Diffusion Statistics

- FiberViewer 1.2.3 used for clustering/analysis

- Fiber process command line tool in DTIProcess

- For each point in atlas bundle lookup data from individual image

- For each bundle project collected data onto 1-d curve via arc-length parameterization. Median of data in cross-section

  - FA

  - MD

Analysis of Tract Statistics

- FiberViewer used to reduce each individual fiber bundle to 1-d function (median statistic)

- Population (N images) collected into spreadsheet NxM (m == # of samples along tract)

- Analysis done using scipy, numpy

- Functional Data Analysis [3]

  - Smoothing

  - PCA

  - point-wise tests (multiple comparison correction)

Results

- Lateralization in Internal Capsule, Cingulum,

    - Possibly due to atlas procedure especially in cingulum

    - Possibly in original data especially in internal capsule

- No statistically significant diffusion differences

- We want to compare the atlas results with individual manual processing
